5. WATER SERVICES INFRASTRUCTURE PROFILE

5.1 Existing water services infrastructure

ZDM has done extensive work on the development of a database that will serve as an asset register, but also to be used as the basis for the development of an asset management system and to capture asset related information electronically for ongoing use. The system has been named 'MANZI' and access can be gained on the ZDM website at www.zululand.org.za once the user has been issued with a username and password.

Table 5.1(a) below provides a brief overview of the schemes in the district that have been captured on the MANZI system and a summary of the infrastructure under consideration, as well as a rough estimate of the value of assets. These figures will be refined over time once the asset management system has been rolled out.

Table 5.1(a): Summary of schemes in the district

SUMMARY DATA	Level of Service	TOTAL	
Number of Schemes	Above RDP - Urban	14	
	Above RDP - Rural	45	
	RDP	85	
	Rudimentary	142	
	TO TAL SCHEMES	286	

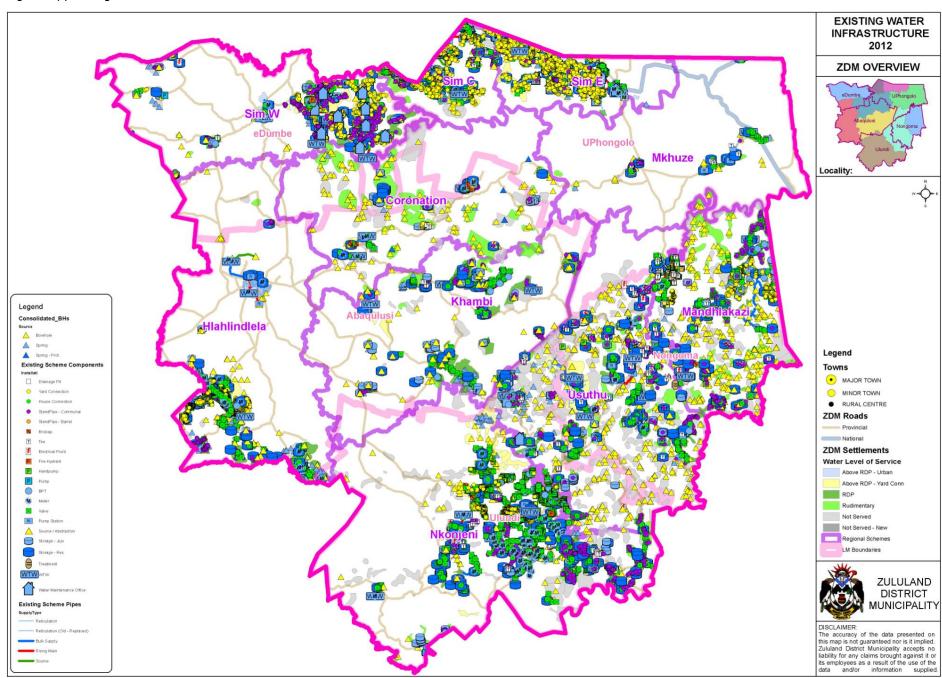

Figures 5.1 (a), (b) and (c) and Table 5.1 (b) below show examples of infrastructure data that is currently available on the GIS system and also on MANZI. Although many gaps still exist in the infrastructure information ZDM is working on getting all information gaps systematically updated.

Table 5.1 (b): Summary of infrastructure components available on the ZDM GIS system

GROUP	COMPONENTS	TOTAL
Pipelines	Bulk	937.9 km
1 pointed	Reticulation	4,255.8 km
	Yard Connection	21,085
	StandPipe - Barrel	302
	StandPipe - Communal	3,681
	Electrical Point	77
	Valve	7,820
	Meter	522
	Bulk Metering Points	58
Installations	Handpump	17
	Pump	19
	Pump Station	104
	Source / Abstraction	441
	Break-pressure Tank	168
	Storage - Jojo	181
	Storage - Reservoir	613
	Treatment (Sand filters etc)	11
	Civil	TBA
Denle com ent Value	Mechanical	TBA
Replacement Value	Electrical	TBA
	Telemetry	TBA

The above table will be supplemented with additional infrastructure details a the final submission of this document. Not all as-built details were available at the time of submission of this draft version.

Figure 5.1 (a): Existing water infrastructure in the district

March 2012 Draft Section 5: Page 2 of 26

Figure 5.1 (b): Typical Bulk Water Scheme details available on the ZDM GIS database (Ulundi Area)

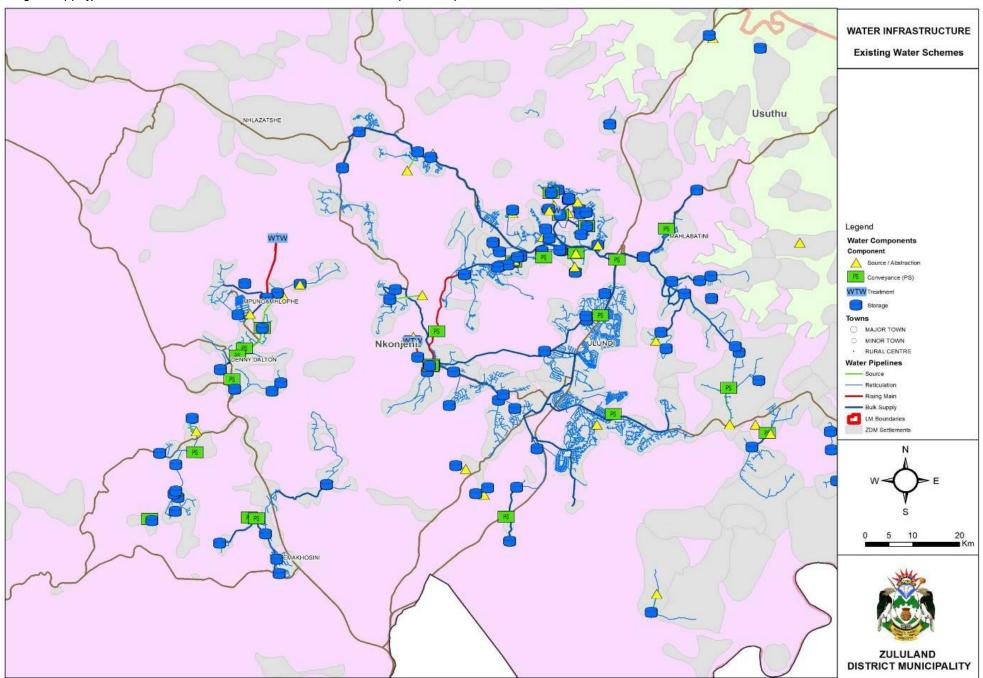

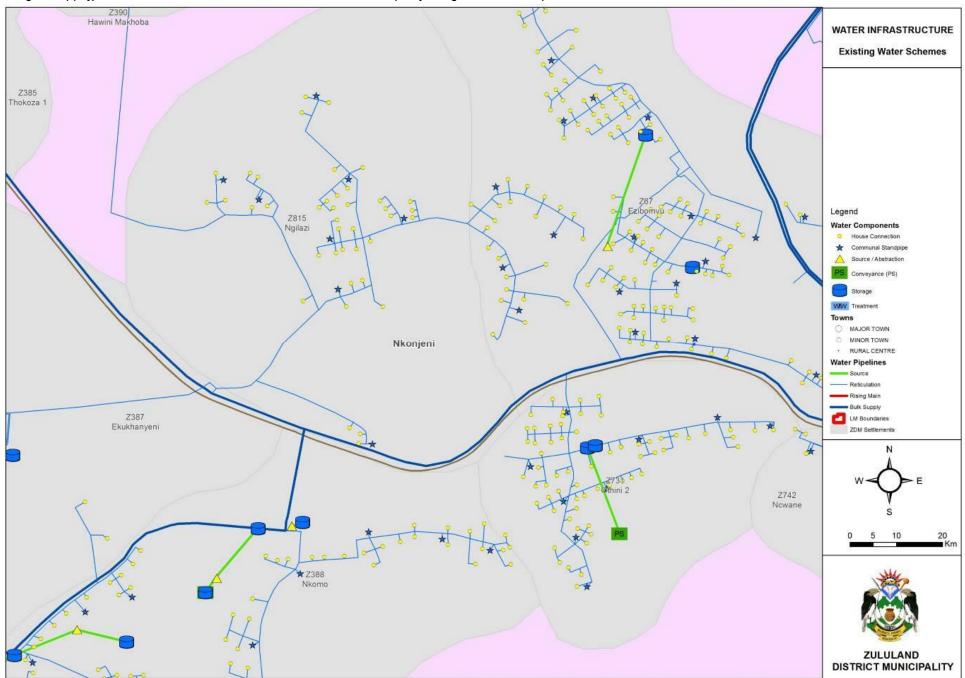

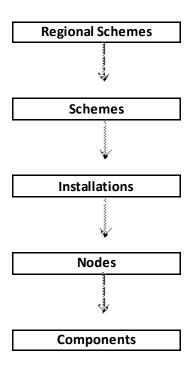

Figure 5.1 (c): Typical Water Reticulation details available on the ZDM GIS database (Nkonjeni Regional Scheme Area)

The asset data in the MANZI system has been structured in a specific data hierarchy as indicated below:

Different asset groups have been identified for water and sanitation infrastructure and these could be either listed as installations, nodes or components. Asset data forms have been developed for each asset group and this is used to capture asset information in the database. The asset data forms provide an overview of the type of information that is available on each asset group. Examples of such asset groups are:

- Water treatment works
- Sewage works
- Pump stations
- Pipelines
- Reservoirs
- Meters
- Valves
- Electrical equipment, etc

The Nkonjeni Regional scheme is again used as an example to illustrate the data hierarchy that has been used. Inside the Nkonjeni Regional scheme footprint there currently exists a number of schemes, varying from RDP to rudimentary schemes. Each of the schemes are allocated a scheme ID number by the system that is used to identify the scheme in all reporting that is used and to link different assets to the scheme. One of the schemes within this footprint is the Babanango scheme and the information captured at "scheme" level is shown in Figure 5.1 (d) below:

ZDM Assets Logged in as: Craig Saunders | Logout Water Telemetry Data Water - Babanango Treatment - Filter by Nodes -- Filter by Components --Treatment ▶ Install 907 4 Q * Scheme Manzi ID: 327
Scheme Name: Babanango
Regional Scheme: Nkonjeni Regional i án) Provided by QuarteX technologies Map data provided by Zululand District Municipality 5981.11377, -3141287.90487 Garage Reports Admin ^ Back to Top Quartex Asset Tool

Figure 5.1 (d): Babanango scheme: Map interface showing scheme detail

The Babanango water treatment works is one of the installations on this particular scheme and the asset data form captured at "installation" level is shown below in Figure 5.1 (e):

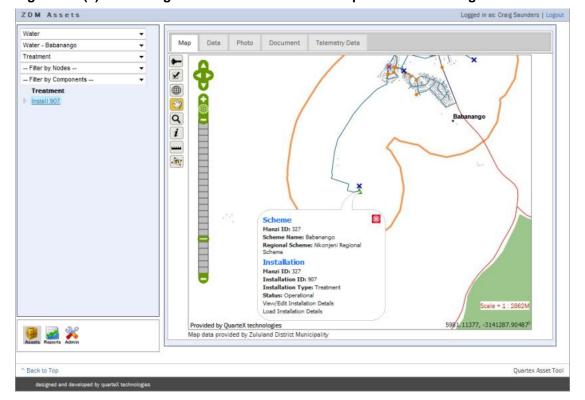

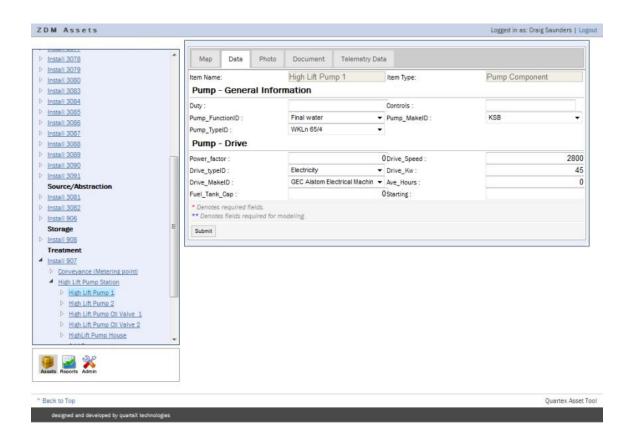

Figure 5.1 (e): Babanango water treatment works: Map interface showing "installation" location

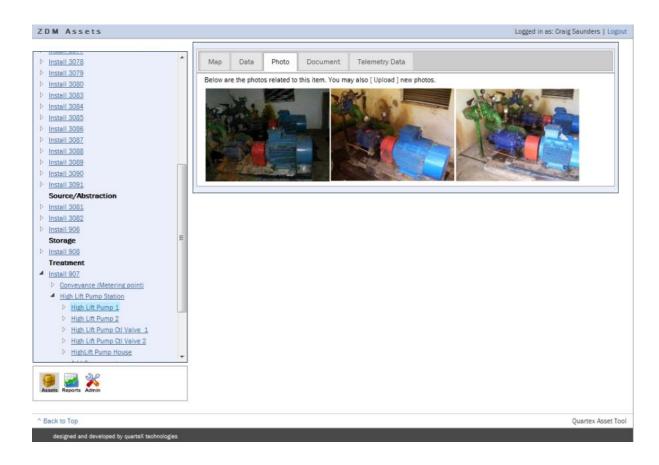

Within the Babanango water treatment works a number of nodes are listed, for example the raw water storage, sedimentation tanks, clarification process, sand filters, etc. The high lift pumping process is used as an example in this case and the asset data form captured at "component" level is shown in Figure 5.1 (f) below:

Figure 5.1 (f): Babanango water treatment works: High lift pumping process: information captured at "component" level – Component details

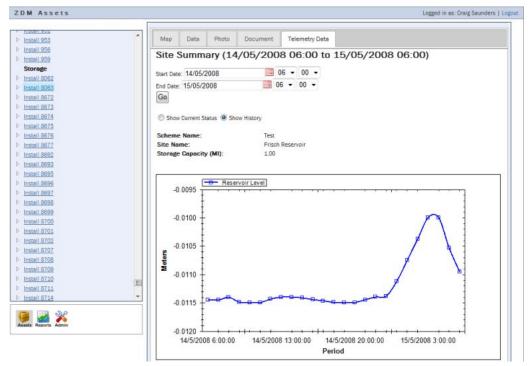

The different nodes within the Babanango water treatment works comprise of a number of components. The clear water pump station is such a node that comprises of various components such as the high lift pumps, electrical equipment, etc. The asset data form captured for the clear water pump station at "component" level is shown in Figure 5.1 (g) below:

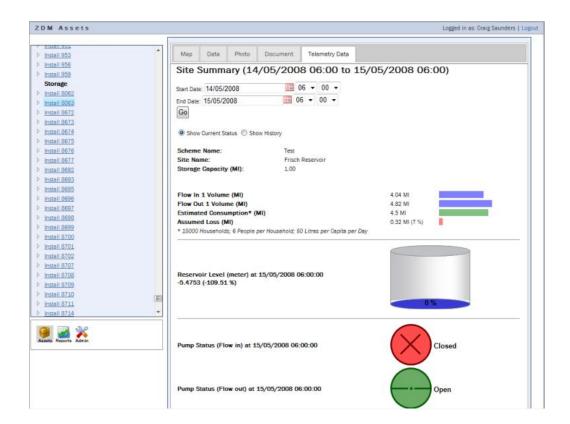

Figure 5.1 (g): Babanango water treatment works: High lift pumping process: information captured at "component" level - Photographs

In the same way documents specific to any level of the scheme map be uploaded to the system.

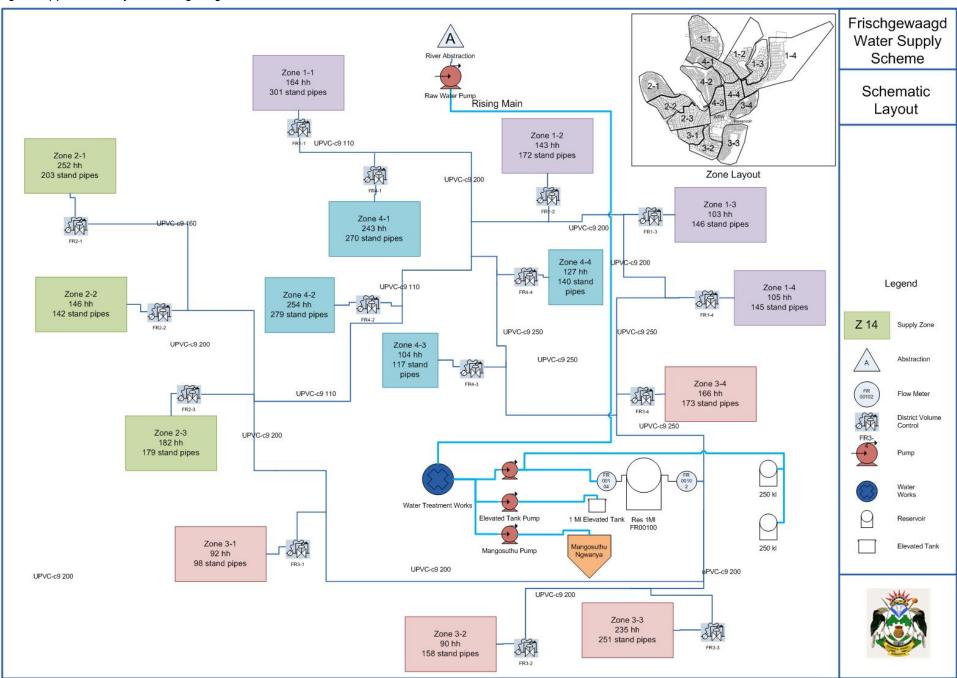

Telemetry has also been linked to the system and where data logging devices are installed, the outputs are presented, an example of the outputs for the telemetry at the Frischgewaagd Plant is shown in the figure below:

Schematic diagrams are also compiled for each scheme and basically summarises the main installations and nodes that make up the scheme. The diagram also shows how the installations and nodes are connected to make up the scheme and the direction of flow of the water or sewage. The schematic diagram also forms the basis for the development of a water balance and telemetry installation for the scheme. The Frischgewaagd scheme is used as an example and the schematic diagram is attached herewith in Figure 5.1 (h) below:

Figure 5.1 (h): Schematic layout of Frischgewaagd water scheme

5.2 Asset management assessment

As mentioned above ZDM is well advanced with the development of MANZI, the ZDM asset management system. The system currently comprises mostly asset data and work is being done to develop operational and maintenance procedures for the assets, which will guide the activities for the ongoing upkeep of asset conditions. Assessments have already been done on certain issues related to asset management and further work needs to be done on other issues, as summarised below:

- <u>Human resources</u> The ZDM Section 78 investigation was finalised in 2007 and identified the most appropriate water services provider arrangement for the ongoing O&M of water services infrastructure in the district. Current staff organograms were compiled and compared with the minimum required staff resources needed to perform the O&M duties adequately. Shortages in staff numbers were identified and are being addressed over time within the ZDM financial means. Training of existing staff was also identified as a crucial element to ensure highly efficient personnel and this is being addressed annually as part of the ZDM Skills Development Plan. Certain functions have also been indentified that cannot cost effectively be developed in-house and will rather be contracted in externally.
- Materials, tools & equipment, transport The Section 78 investigation has also identified shortcomings in this regard and has listed vehicles and equipment to be purchased in order to have fully functional O&M teams. The need for additional stores has also been identified throughout the district and these are progressively being addressed with the available funding.
- <u>Budget</u> The Section 78 investigation has identified the funding requirements at present and in the
 future to adequately operate and maintain existing assets and new assets to be added over time. This
 information guides the preparation of the annual O&M budget, although available financial resources
 are not sufficient.
- Asset information The locality information on assets is very good and particularly the water assets are viewed to be more than 80% covered. Sewerage information is still lacking but is being addressed. Asset information that also still needs further work includes as-built information, design reports, operating manuals, safety plans, etc. Assessments were also done on asset conditions to determine a brief overview of the status of assets and start identifying where urgent work needs to be done. Photographs were taken of each asset visited and have been included into the MANZI system.
- Risk management ZDM realises that available resources will never really be sufficient to address all
 needs at once and therefore work has started on the development of a risk based approach to asset
 management. This model will consider the risk of failure of an asset, the consequence of such a failure
 and the probability of a failure occurring. This will all be compared to ensure that resources are applied
 where really needed most.
- Reporting The ZDM WSP reporting system will feed back valuable information to management regarding O&M activities and asset performance. This information will be used to adjust asset management priorities if needed and also track the efficiency of asset management projects that are being implemented.

5.3 Schemes to be transferred

All schemes and related staff that were identified to be transferred from DWAF and Department of Works to ZDM have been concluded. There are other schemes in the district still being operated by National Department of Works, e.g water services at prisons, but no formal or informal request have yet been entered into for the transfer of these schemes.

5.4 Schemes to be rehabilitated

There are currently a number of investigations underway to determine the refurbishment requirements of water services infrastructure in the district. The refurbishment requirements at bulk plants are receiving first priority since it is perceived that the most urgent interventions are required at these assets. Investigations are also being commissioned to determine the condition of urban infrastructure and the refurbishment needs in the towns. Whilst new infrastructure has been rolled out in the rural areas to previously neglected communities, the infrastructure in towns have received very little attention and funding since 1994 and it can be expected that most of the refurbishment requirements will be in these areas. The above mentioned investigations have not yet been fully completed and the results will be included once available.

Assessment of the bulk water and sewage works:

During June 2009 consultants were appointed to assess the Water and Waste Water Works in Zululand District Municipality. The assessments included recommendations and cost estimates to refurbish and/or upgrade these works in the short term and medium to long term. These assessments also recommended emergency interventions.

This Technical report was compiled to secure funding for the emergency interventions, short term refurbishment and medium to long term upgrading.

Emergency interventions are needed where work is needed to attend to fatal problem areas, such as settlements consuming raw untreated water, sewer water spilling directly into rivers and structures that is almost collapsing. Short term refurbishment (not critical work) is needed to refurbish and upgrade the existing works in order to meet the current demands and also to enable the works to function at its design capacity. These short term refurbishments were prioritised using criteria such as cost per capita and current demand versus current capacity.

Medium to long term upgrading (not critical work) is needed to upgrade the existing works in order to meet the future demands. These long term refurbishments were prioritised using criteria such as cost per capita and future demand versus the capacity after short term refurbishment. Some of these works will become redundant in future (As they will be incorporated into larger regional schemes). This was also taken into account.

5.5 New infrastructure to be built

Water infrastructure:

During 2004 the ZDM started a comprehensive water master planning exercise to determine the most appropriate methods of providing previously neglected communities with water services. In all cases the main drivers were to obtain the technical solution that will not necessarily be the lowest in terms of capital requirements to implement, but rather that will provide a sustainable service throughout the year (sustainable water source) at the lowest possible water tariff (R/kl). The first step was to identify sustainable water sources in the district that could be used to provide water supply even during extreme drought situations and then to determine the most cost efficient way of supplying communities from these sources. The planning methodology that was used can be summarised as follows:

- Identify logical supply footprints
- Identify all possible options for supplying water to supply footprints
- Determine the capital and operational costs associated with each option
- Evaluate each option
- Decide on most appropriate solution

From the above planning process the entire district was covered with 10 back to back regional schemes, which are listed below and indicated on Figure 5.5 (a) attached herewith:

- Nkonjeni Regional Scheme
- Usuthu Regional Scheme
- Mandlakazi Regional Scheme
- Mkhuze Regional Scheme
- Simdlangentsha East Regional Scheme
- Simdlangentsha West Regional Scheme
- Simdlangentsha Central Regional Scheme
- Coronation Regional Scheme
- Khambi Regional Scheme
- Hlahlindlela Regional Scheme

Also indicated herewith on Figure 5.5 (b) is the planned future bulk infrastructure that was identified from the above planning process.

Sanitation infrastructure:

Further planning work is still required in the urban areas to confirm the suitability of the bulk infrastructure, especially with regards to increased pressures on this infrastructure due to an increasing urbanisation trend that has been occurring and also to allow for future growth in population.

Sanitation infrastructure being provided in rural areas (previously unserved communities) is limited to household VIP toilets. The units are being implemented on the back of the water infrastructure roll-out plan.

Pre-cast Manufacturing Plants

As part of the Rural Sanitation Programme rollout, a Local Economic Development intiative was envisaged by ZDM, to establish a local manufacturing plant producing the pre-cast material for the rural sanitation units. Two locations were initially proposed for manufacturing plants, namely Ulundi and Vryheid.

The manufacturing plant in Ulundi was erected and established in 2008 via the Rural Sanitation Project funding. At present it is managed by Conloo, a division of Conrite Walls. The objective is that the manufacturing plant will be handed over to local business partners, and in doing so promote local economic development.

Estimated costs:

Table 5.5 (a) below summarises the estimated costs to provide sufficient water services infrastructure to all households in future:

Table 5.5 (a): Cost of new infrastructure to be built
